Croftweaver

A website built to be found, in plain files you own

And a move off WordPress that lists your old addresses and checks each one on the list.

croftweaver.com

BEING FOUND

Build high-ranking websites. The proof so far comes from one site.

One site, measured: genai-wednesday.de, launched on 27 March 2026.

- **Speed and search basics.** PageSpeed Insights on a simulated phone, 4 October 2026: 99, 100, 100 and 100 out of 100 for performance, accessibility, best practices and SEO.
- **Clicks from Google.** From 3 in the 28 days that include the launch (18 March 2026 to 14 April 2026) to a best 28 days of 99 (16 June 2026 to 13 July 2026), and 50 in the latest 28 days (2 September 2026 to 29 September 2026).
- **AI assistants.** On 19 October 2026, 16 of 22 answers given with web search named the site, and 0 of 24 given from memory. The proof page says why the second number is zero.

> It is one site, and it belongs to the maintainer of Croftweaver. Clicks have fallen from their best, and the cause is not established. The proof page has the sources, the daily numbers and what the figures do not show. Tests check each change before it goes out: croftweaver.com/checks.

MOVING OFF WORDPRESS

Nobody can promise your rankings. A move can keep your addresses working.

The move, in six steps

1. Count the old site
2. Decide what moves
3. Rebuild with the skills
4. Write the redirects
5. Check each address on the list
6. Launch, then watch

Will we lose our Google rankings?

Nobody can promise that you keep them. What a move can do is keep every address that matters working: the same address on the new site, or a permanent redirect (301) to the page that replaced it. The helper lists the old addresses it finds before the move and checks each of them afterwards, together with any you add to the list by hand, so an address on that list that leads nowhere is found before your visitors find it. Watch Search Console for a few weeks after the switch.

> The helper's first trial on a real WordPress site, what it found and where it stops: croftweaver.com/from-wordpress#proof.

SECURITY

Less of the site's own code runs when someone opens a page.

A WordPress site, for a request that no page cache answers

VISITOR	The browser asks the server for the page.
RUNS CODE	PHP starts.
RUNS CODE	WordPress runs.
RUNS CODE	The plugins run.
RUNS CODE	The database answers.
VISITOR	The finished page goes back.

A Croftweaver site

VISITOR	The browser asks for the page.
RUNS CODE	According to Cloudflare's documentation, one short function of the site runs on each request. On croftweaver.com it passes the request on unchanged.
NO CODE	Cloudflare hands back a file that was built in advance.
VISITOR	The page arrives.

> We give no overall ranking. No single fact about what runs on a server settles one, and every site depends on its accounts. The flaws on each side, with their sources: croftweaver.com/security#risks.

IS IT FOR YOU?

Made for content sites. For the rest, stay on WordPress.

Stay on WordPress when

- You run a shop on WooCommerce, or need memberships, accounts or a booking system.
- Several colleagues edit the site in the browser and do not use an AI assistant.
- A plugin you cannot do without has no counterpart on a static site.
- Your WordPress site runs well and costs you little time. Then there is no reason to move.

After the move

- Changes are made by someone working with an AI coding assistant: a person on your team, or someone you ask.
- There is no editor in the browser.
- The domain and the GitHub and Cloudflare accounts are in your name.

NEXT STEP

Talk it through in a first call.

Daniel Melter of M-Squad maintains Croftweaver, and genai-wednesday.de, the site measured on slide 2, is his.
